GLOBAL WARMING will be the largest single problem confronting our water supplies in the coming years. If you are having water problems with your drilled well today you can expect that they will only get worse in the years to come. At Pine Veau Fracturing we can help you solve your low producing or dry well troubles today.

HYDRO FRACTURING is the process of using water under extreme pressure to break away the blockages that are preventing the underground water source from flowing freely into your well. With over 95 years of proven success in the oil fields this is not a new technology. What is new within the last 20 years is the application of Hydro Fracturing within the water well industry. Our machine fractures the underground rock and opens up the already existing fissures in the rock allowing water to freely flow into your well.

HIGHLY TECHNICAL MACHINE The high-pressure components for our machines have come directly from the oil fields. Our machines are capable of producing over 6000 pounds per square inch (psi) and pumping up to 200 gallons per minute (GPM) creating extremely high pressure in the well. This high pressure increases our likelihood of opening blocked water veins and producing a higher output well. By fracturing an existing drilled well, we can improve the flow of the well, even if the hole is considered dry, or has gone dry after many productive years.

The cost of drilling a new well can be considerable with no guarantee of any success. When we fracture an existing well; there is no mess of digging up lawns, cutting asphalt driveways or the mess, noise and expense of drilling a new well. By utilizing the best of industry technologies we have been able to increase our success rate to over 99%. Using our exclusive design we can isolate 12 – 20 foot zones in the well. By blocking the top and bottom of the zone no pressure can go beyond the two packers. This allows us to open up more areas in the wells called aquifers.

Our system can also be solution to bad water problems. Using our unique technology we can isolate the areas where good water is located. For example if salt or sulphur is found at the bottom of the well, we can plug this lower area and fracture above where better quality water is located.

AVOID UNNECESSARY COST - If you have an existing well or are considering drilling a new well. Call us first. **We can save you money!**

In 99% of all wells that we have hydro fractured, we have found water between 50' & 300'.
